Background Suppression Photoelectric Switch

HP350-G Series | A distance-specific switch that suppresses background interference

- Detection occurs at the specified distance.
- Suppression of background: influence from metal such as aluminum or stainless steel in the background is suppressed.
- Influence from color variations in target object is suppressed.
- Red light produces a clearly visible spot.
- Small differential enables thickness detection.
- Click-action 6-revolution potentiometer

**DETECTION PRINCIPLE**

Using triangulation as shown below, the position of the target object is determined based on the position of the image formed on the light-receiving element, which differs depending on the distance of the target object.

The distance setting of the HP350-G is adjusted by moving the lens up and down with the potentiometer.

**Correlation between target object position and image formation position**

When the target object is in the set position, its image is centered on a bisected photodiode, which is the light-receiving element (solid line).

If the target object is closer to the lens than the set position, the image is displaced upward (dotted line).

If the target object is farther from the lens than the set position, the image is displaced downward (dotted line).

**Relationship of lens position and set distance**

Turning the distance setting potentiometer moves the lens. If the set position is close, the lens is low, and if it is far away, the lens is high.

NOTES FOR USE OF HP350G SERIES

1. Precautions for handling

- Tighten mounting screws to a torque of 0.5 N·m or less.
- It takes a maximum of 200 ms for the switch to operate after power is supplied.
- If the switch is installed outdoors, put it in a case so that it is not directly exposed to sunlight and rainwater.
- To prevent misalignment of the optical axis, do not install the switch where there is strong shock or vibration.
- Water on the lens can cause a malfunction. Install a shielding plate or the like to keep water off of the lens.
- Do not use the switch in a chemical atmosphere (organic solvents, acids, alkalis, etc.).
- If the switch is used in a location where there is strong ambient light, block the light with a hood, or change the orientation of the switch and then check that it functions properly.
- Prevent sunlight and fluorescent light (especially light from an inverter type fluorescent lamp) from directly entering the receiving element.
- When the switch is used in a dusty environment, take measures to prevent dust from accumulating on the sensing surface of the fiber unit, such as putting it in a sealed case and using an air purge.
- Do not use the switch where it is continuously exposed to water or where it could become immersed in water. Also, keep the ends of the cable from coming into contact with water.
- Never use the switch where it can be splashed with oil or coolant.
- The bending radius of the cable where it exits the switch body must be 30 mm or more. Also, do not use the cable in a manner that repeatedly subjects it to bending stress.
- Pulling the cable with excessive force may cause a disconnection.
- The photoelectric switch is assembled with high precision. Never hit or drop it.
- If the light-emitting or light-receiving surface become dirty, lightly wipe with a soft clean cloth, either dry or moistened with water. Do not use organic solvents such as alcohol, benzene, acetone, and thinner.
- If multiple photoelectric switches are used in close proximity, they may not operate reliably. After installation, be sure to carefully check switch operation before use.
- The relationship between the target object’s direction of approach and the orientation of the switch should be as shown below.

- The detection distance specification is 20 to 200 mm. Use the switch within this range.
- At low temperatures (0 °C or below), the cable will stiffen. If this happens, do not bend the cable or subject it to vibration or shock.

2. Precautions for wiring

- If it is necessary to extend the cable, use wire with a cross-sectional area of 0.3 mm² or more that is no longer than 100 m.
- If the wiring for the photoelectric switch is run through the same conduit as high-voltage or power lines, induction may cause malfunction or damage. Route the wiring in a different conduit or its own conduit.
- When using an off-the-shelf switching regulator, ground the frame ground and the ground terminal. Otherwise, switching noise may cause malfunction.
- When a load such as a capacitive load or an incandescent lamp is connected which results in an inrush current that exceeds the switching capacity, connect a current-limiting resistor between the load and the output terminal. (Otherwise, the output short-circuit protection may be activated).
- If strong surges occur in the power supply, connect a surge absorber to the power source.
- If the photoelectric switch breaks, there is a possibility of excessive current flow. Restrict current use to 3 A or less.

3. Adjustment method

Follow the procedures below to set the distance. (For dark-ON operation, replace “turn on” with “turn off,” and vice versa, in descriptions of the output indicator.)

<table>
<thead>
<tr>
<th>Order</th>
<th>Distance setting potentiometer</th>
<th>Adjustment procedure</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td><img src="Diagram1" alt="Diagram" /></td>
<td>With the photoelectric switch and target object fixed in place, first turn the potentiometer counterclockwise until the output indicator turns off. From that position, turn the potentiometer clockwise. The position where the output indicator turns on is point A.</td>
</tr>
<tr>
<td>2</td>
<td><img src="Diagram2" alt="Diagram" /></td>
<td>Next, remove the target object and check that the output indicator turns off. Turn the potentiometer clockwise from that position. The position where the output indicator turns on (detects the background) is point B.*1</td>
</tr>
<tr>
<td>3</td>
<td><img src="Diagram3" alt="Diagram" /></td>
<td>The midpoint between points A and B is point C. Set the potentiometer to point C.*2</td>
</tr>
</tbody>
</table>

*1. If the background is too far away to be detected, a position that is one clockwise revolution or more from point A should be used as point C.
*2. Since this is a multi-revolution potentiometer, it may take more than one revolution to reach point B from point A.

Output indicator (yellow)

- 3. Distance setting potentiometer (6 revolutions, continuous potentiometer)
- 4. This switch is not equipped with a stability indicator.

Before use, thoroughly read the “Precautions for use” and “Precautions for handling” in the Technical Guide on pages A-141 to A-156 as well as the instruction manual and product specification for this switch.
